TRAFFIC ESCAPE – LLM PROMPTS

TASK1:

I have this Traffic Escape pygame project and I need to complete the tasks given in the assignment one by one.
For now, do only Task 1: Lives System.
The player should start with 3 lives. Whenever the player gets hit by a car, one life should be lost. The remaining lives should be shown on the screen. When all 3 lives are lost, the game should end and show Game Over.
The R key should restart the game and give the player 3 lives again.
Please first look at the existing code and understand how the player, collision and restart currently work. Make the changes in the existing code instead of rewriting the whole game.
Don't implement the other tasks yet. Keep the existing controls and gameplay working.
After making the changes, tell me which files you changed and how I can run and test it.

TASK2:

Task 1 is completed. Now implement only Task 2.
I want one of the existing vertical lanes to be a special log/raft lane.
Do not add a horizontal water area or change the overall road layout.
In this one lane:

- No cars should spawn or move.
- Only the player's vehicle can enter this lane.
- Add a moving log in this lane.
- The player must get onto the moving log to cross the lane.
- The log should move continuously along the lane.
- When the player's vehicle is on the log, it should move with the log.
- If the player tries to cross the lane without being on the log, they should lose one life and return to the starting position.
  Keep all the other traffic lanes working exactly as before.
  Keep the 3 lives and R restart from Task 1 working.

TASK3:

Task 1 and Task 2 are completed. Now implement only Task 3.
Add a high score system to the game.
The game should keep track of the top 5 scores and save them in a JSON file so that the scores are still available after closing and reopening the game.
Display the top 5 scores in the game when appropriate, such as on the Game Over screen. When a new score is achieved, add it to the high score list, sort the scores from highest to lowest, and keep only the top 5.
Make the minimum changes needed and use the existing score/game-over logic. Keep Task 1 (3 lives) and Task 2 (moving log lane) working.

TASK4:

Task 1, Task 2 and Task 3 are completed. Now implement only Task 4.
Add a day/night cycle to the game. Every 30 seconds, switch between day and night.
During the day, keep the current game appearance.
During the night, make the game darker and add headlights to the cars. The headlights should be visible farther in front of the cars so it is clear that the game is in night mode.
The day/night cycle should continue while the game is being played.
Keep the existing 3 lives system, moving log/raft lane, high score system and R restart working exactly as they are.
Use the existing game code and make the minimum changes needed. Don't redesign the game or add unnecessary features.
Don't change Tasks 1, 2 or 3.

- After testing Task 4, the player's vehicle headlights were not visible during night mode, so an additional prompt was used to fix this issue.

The night headlights are working correctly on all traffic cars, but I noticed one issue: **the player's vehicle does not have headlights during night mode**.
Please fix only this issue.
During night mode, the player's vehicle should also have clearly visible headlights projected in front of it, similar to the traffic cars. Since the player vehicle moves upward/downward, make the headlights appear in the direction the player vehicle is facing/moving.
Keep the existing traffic-car headlights exactly as they are.
